Mobile development Task2:

Alejandro Martín & Albert Ramisa

Our project:

Our project consists of the following: we want to develop an app that will allow you to search for your favorite games ,rate them and also check their community artwork. These rates will be globally saved with the usage of Firebase. Also we will allow the users to store their favorite games in order to access them again whenever they want to check ratings or see the latest artwork done by the community for that game.
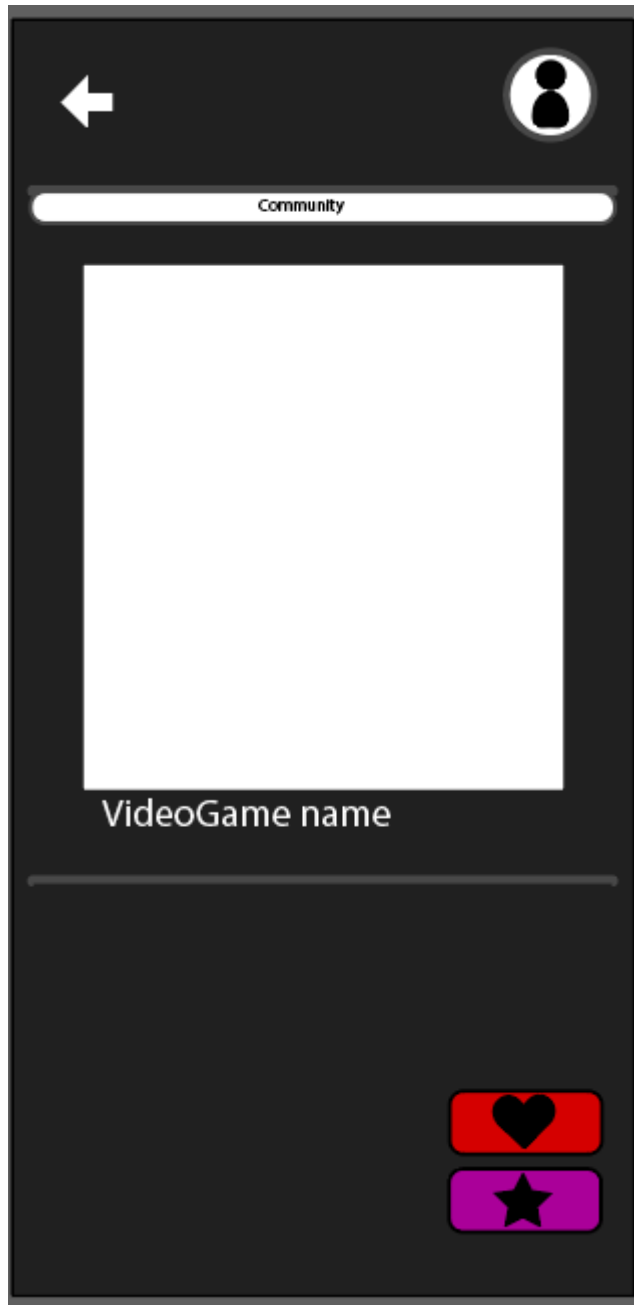

Obviously our app is still not developed fully but we intend to improve the aspect and the capabilities we want to end up with.

Planned screens:

Home page: Just a simple searcher

VideoGame page: Page where you will see the videogame and interact with it.

Community

VideoGame name

User page: Simple page to check all the games that you have on favourites

Artwork page: Page to check all the artwork uploaded for that game

VideoGame name

Ratings page = Here you will be able to rate your favourite games
